

CurricuLab

The Student Centric Study Management System

The Coordinator

Tanu Chaudhary

Workflow and Project Manager

Version 1.2 Beta

Team Details

Tanu Chaudhary is a student of MBA (Business Analytics) from Sandip University and worked as the Workflow and Project Manager for this project. Her responsibility was to identify the project requirements properly and ensure that all team and members knew what they were supposed to do.

She was also responsible for coordinating with the technical team, data acquisition team, research and quality management team to ensure that all activities were properly organized and on track.

Acknowledgement

The Special Thanks to our teachers Dr. Zahir Shaikh and Dr. Samadhan Bundhe from Sandip University for their precious guidance and support. We are glad to have such guide or mentor who help us to review and evaluate the process continuously to avoid any neglecton.

Under the Guidance of Dr. Zahir Sir, we have applied the various concepts of Business Research Methods, while under the Guidance of Dr. Samadhan Bundhe, we have applied the concept of Data Management and Warehousing along with SQL handling.

Business Problem

As college students, we face a common problem in managing our academic information. Every day, we switch between different platforms just to stay updated. For timetables and assignments, we check ERP. To receive important announcements, we can use WhatsApp. For study materials, we open Google Classroom. Since everything is scattered across multiple apps, it often becomes confusing and time-consuming. Many times, we miss important updates because they are shared in different groups or someone forgets to forward a message. There is no single platform designed specifically for students where all academic resources are available together in one place.

This creates a gap in smooth communication and organized access to information. Students mostly depend on classmates for notes, assignment updates, and important reminders. When required information is not shared with others appropriately, students will be negatively impacted academically.

This project creates a student - centred management and support for the classroom using a system built by the students. The platform consolidates all the academic resources into one central database for students to access, including notes, assignments, announcements, and study materials. The new system would not replace ERP or Google Classroom; however, it enhances them to allow students easier access to their resources in an organized manner.

Additionally, the platform includes a “Career Gateway” page under the tools section, where students can find interview lineups and job openings. Overall, this system aims to save time, reduce confusion, and make student academic life more structured and manageable.

Team Distribution

Team	Member	Role
<i>Coordinator</i>	Tanu Chaudhary	Workflow and Project Manager
<i>Technical Team</i>	Harish Chavan	Code Base Manager and Core Developer
	Kaustubh Nandurkar	APIs and Database Manager
<i>Data Acquisition Team</i>	Anukriti Shrivastava	Resource Manager
	Tejas Patil	Assistant Resource Manager
	Manishankar Veermalla	Junior Resource Manager
	Georgetta Wilson	Junior Resource Manager
<i>Research & Quality Team</i>	Kaif Shah	Quality Assessment Manager
	Akash Jayaprakash Mangalumthodi	R&D Manager

Project Description

To turn our idea into reality, we decided to build a simple and practical website system specially designed for students like us. We divided the platform into different sections such as Academics, Study Material, AI Tools, Personal Growth, and Community. The main goal was to make everything feel organized and easy to access. The data acquisition team collects useful resources, and before anything is uploaded, the research and quality management team checks it properly so that students get accurate and relevant information. This way, the platform remains reliable and structured.

After several discussions with the research manager and the technical team, we chose Antigravity IDE to build and generate the frontend of the website because it made the development process smoother. For handling data and storage, we selected Supabase as our database so that everything can be managed efficiently in the background.

For the AI features, we integrated three LLM providers: OpenRouter, Grok, and GitHub to support different AI-based tools within the system. To make things even more convenient, we connected our platform with Google Classroom using the Google Classroom API. This helps in directly fetching study materials and assignments, so students do not have to switch between multiple apps. Overall, the system is designed to feel simple, organized, and student-friendly while still being technically strong in the background.

Objective

The main aim of this project is to create a student-centric study management system that truly understands the daily challenges students face. It is designed to help students store and organize their study materials in one place so they don't have to search through multiple apps or chats. Along with managing resources, the system also supports skill development and interview preparation through AI tools, helping students track their growth and prepare confidently for future opportunities.

Another goal is to build a platform where students can access everything they need anytime and from anywhere with just a single click. Whether it's notes, assignments, or preparation material, it should be easily available without confusion or delay.

In addition, the platform provides extra tools that help students improve their studies in a practical way. These tools are meant to make learning more structured, productive, and focused, while also supporting overall personal and professional development.

Key Features

Our system includes some simple but meaningful features that are designed by keeping students' real needs in mind.

1. **Knowledge Vault** – This is like a personal storage space for students where all notes, study materials, and important documents are kept in one organized place. Instead of searching through different chats and apps, everything can be found easily here.
2. **Classroom** – This section brings academic updates together in one space. It connects with platforms like Google Classroom and ERP so students can check assignments and study materials without switching between multiple apps.
3. **Career Gateway** – This feature focuses on future opportunities. It provides updates about interview lineups, job openings, and preparation support, helping students stay informed and career-ready.
4. **Skill Forge & Resume Studio**– This section helps students work on their skills and build their resumes. It guides them in creating and improving their resumes in a structured way, making them more confident for placements and interviews.

Learning Outcomes

Through this project, several important learning outcomes were achieved. First, it helped in understanding how to set up and use **Antigravity IDE** along with Supabase to develop a full-stack application, including both **frontend development and backend database** management.

Second, it provided practical knowledge on how to create a **custom GPT** for personalized use. This helped in reducing content inconsistency, minimizing hallucinations, and improving contextual accuracy while generating AI-based responses.

Lastly, the project gave **hands-on experience** in obtaining and integrating different APIs to perform various tasks, such as fetching data and connecting external services with the system. Overall, it strengthened both technical understanding and practical implementation skills.
